Fact Sheet: Infantry Gunnery and Tactical Simulator

06 Jun 2008

The Infantry Gunnery and Tactical Simulator (IGTS) is the latest addition to the Singapore Armed Forces' (SAF) range of training simulators.

Employing realistic state-of-the-art simulation software, the IGTS allows Army personnel to hone their weaponry skills. Commanders will also be able to practise and improve their tactical decision-making abilities with the multiple warfare scenarios available in the IGTS.

The IGTS consists of two main components: a Commander Tactical Trainer and a Support Weapons Simulator.

Commander Tactical Trainer - Used by commanders to practise their battlefield planning, coordination and execution skills before actual field exercises. The inclusion of variable insertions as such 'enemy' forces and other real-time battlefield developments allows for different levels of training.

Support Weapons Simulator (SWS) - Used by soldiers to acquire and hone their gunnery skills, before such skills are validated in outfield training.

The SWS consists of:

- 120mm Mortar Indirect Fire Weapon Simulators
- Anti-Tank Guided Missile Simulators
- Shoulder-Fired Anti-Tank Weapon Simulators
- Grenade Launcher Simulators
- Machine Gun Simulators

Since the beginning of 2008, the IGTS has been used by regulars, Full-time National Servicemen (NSFs), and Operationally-Ready NSmen from the SAF's Infantry and Guards units.

Each year, about 14,000 personnel are expected to use the IGTS for training.
